

### **Electrical in Camping Units**

*We already have electrical codes specified under SPS 324, now we have a whole new set of codes in addition to this? Are they completely different?*

There are three additional subsections which differentiates SPS 327 electrical standards from SPS 324.

**SPS 327.51(3)** Except as provided in s. SPS 327.11, the inspection of the electrical construction of a camping unit is not required. (Note: **SPS 327.11** requires rough and final electrical inspections)

**SPS 327.51(4)** No more than one receptacle outlet is required to be installed for the entire countertop space of a kitchen in a camping unit.

**SPS 327.51(6)** The ampacity of a conductor providing service to a camping unit and rating of the service disconnecting means may not be less than 50 amperes.

---

*How do I inspect for electrical roughs and finals?*

The same as a one or two family dwelling, except:

- The kitchen countertop space is only required to have one receptacle.
- See SPS 327.26 for smoke detector locations. Not required to be hardwired.
- See SPS 327.27 for Carbon monoxide alarm location. Only required to be hardwired w/ battery backup if the unit has electricity provided by a public utility.
